Brooklyn-based firm Carlos Arnaiz Architects (CAZA) has revealed plans for the Ospital Pacifica de Juan and Juana Angara in Baler, Philippines. The \$8 million project, a hospital–trauma center hybrid, is slated to begin construction next month and open in March 2018.

The design was conceived and funded by Dr. Ed Corpus, Jr. and Balernative Senator Edgardo Javier Angara as a means to address growing healthcare and trauma needs in the remote community. The 65,875-square-foot plan will have a daily capacity of 75 people, and house an abundance of medical services from maternity wards to operating and imaging rooms to a chapel and café. The structure will also therapeutically reinforce the natural setting with undulating canopies that take on an architectural form in the open field. A series of courtyard gardens will be located within each of the hospital's four main zones, perpetuating the connection with nature while also infusing natural light.

Staff will be circulated zealously through an integrated spine that will create a centralized service delivery mechanism, complemented by a prominent portico along the perimeter. The modular prototype will be prefabricated in order to be replicated for other rural communities in similar need.
